

Truss Jib

Truss Jibs - A truss jib is actually utilized to be able to lift and place trusses. It is an extended jib attachment which is equipped with a pyramid or triangular shaped frame. Normally, truss jibs are mounted on machines like for example a skid steer loader, a compact telehandler or even a forklift utilizing a quick-coupler accessory.

Older kind cranes which have deep triangular truss jibs are normally assemble and fastened using bolts and rivets into standard open structural shapes. There are hardly ever any welds on these style jibs. Each riveted or bolted joint is susceptible to rust and therefore requires regular maintenance and check up.

Truss jibs are made with a back-to-back collection of lacing members separated by the width of the flange thickness of another structural member. This particular design can cause narrow separation amid the flat surfaces of the lacings. There is little room and limited access to preserve and clean them against rust. A lot of rivets become loose and rust in their bores and should be changed.
