

Fork Positioner for Forklift

Fork Positioner for Forklift - The fork positioner is actually a hydraulic device which could allow the the one driving to work the forklift without leaving the seat. They are constructed out of top quality materials and are designed to be able to withstand the most difficult procedures and work surroundings. Side shifting units have the extra ability to be able to laterally position the arms or the entire load in order to facilitate much more precise carrying and position in a faster and much more effective way.

The unique blade pocket design could enable the one operating it to safely swing the unit's blades without any fear of destroying the positioning cylinders. This could allow the worker the choice to either perform independent or simultaneous blade movement, dependent upon the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are needed. Standard OEM carriages can be transformed into fork positioners on existing units.
